Application/Control Number: 09/851,721 Page 2

Art Unit: 2126

DETAILED ACTION

1. Claims 1-20 are presented for examination.

2. The cross reference related to the application cited in the specification must be updated (i.e. update the relevant status, with PTO serial numbers where appropriate, on page 2, lines 2-3).

Claim Rejections - 35 USC § 112

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

4. Claims 1-20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1-20 do not specify what is the use and purpose of the claimed invention.

Correction is required.

Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 1-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Allen (U.S. 5,727,214) in view of Pai (Flash: An efficient and portable Web server).

Art Unit: 2126

- 7. **As to claim 1**, Allen teaches a finite state machine operating within a thread environment (cursor state machine; col. 7, line 65 col. 8, line14), one or more message generators configured to pass event information contained in message to the finite state machine (Event ... function new_event (), port of origin; col. 7, line 66- col. 8, line 5 and New_event() is the procedure called by a process sending an event to the object; col. 9, lines 1-6), wherein the finite state machine changes states according to the event information (The object lock state machine, the main cursor sate machine; col. 8, lines 25-57 and Figs. 7A, 7B and Accept_event () ... state transitions in the cursor state machine 126; col. 9, lines 30-33).
- 8. However, Allen does not teach a portable thread environment. Pai teaches a portable thread environment (portable Web server, page 1, right column, 4 paragraph).
- 9. It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teaching of Allen and Pai because portable thread environment will improve the performance of Allen's system by combining the high performance of single-process event-driven servers on cached workloads with the performance of multi-process and multi-threaded servers on disk-bound workloads (abstract).
- 10. As to claim 2, Allen teaches the event information comprises one or more events passed to a thread and a present state of the finite state machine (the software object ... a single thread

Art Unit: 2126

object; col. 8, lines 1-5 and When an object's port ... cursor state machine for use in objects having asynchronous ports; col. 8, lines 11-15).

- 11. **As to claim 3**, Allen teaches a message interpreter configured to accept the messages (The event dispatcher ... for the main system; col. 3, lines 58-65), wherein the interpreter maps the messages to actions using the look-up table (The event dispatcher utilizes a disposition ... of the major state variable; col. 4, lines 18-22 and col. 3, line 66 col. 4, line 5 and col. 11, lines 1-11).
- 12. **As to claim 4**, Allen teaches the finite state machine further comprises a storage device for storing the one or more action (every port is endowed with a set of disposition ... events; col. 11, lines 31-41 and a Disposition Rank Matrix 200; col. 12, lines 7-11).
- As to claim 5, Allen teaches the finite state machine further comprises a state changer configured to change the state of the finite sate machine based upon event information and the previous state of the finite state machine (Accept_event() ... cursor state machine 126; col. 9, lines 30-33 and Figs. 7A-7B).
- 14. As to claim 6, see rejections of claims 1 and 5 above.
- 15. As to claim 7, Allen teaches the finite state machine stays in the first state based upon the first state and the action (Object Locked state; Fig. 7A and Event submitted state; Fig. 7B).

Art Unit: 2126

- 16. **As to claim 8**, Allen teaches generating state machine events relating to the state of the finite state machine (Event Dispatching, it can also calls to new_event() to submit additional events to itself or to another object; col. 10, lines 27-44).
- 17. **As to claim 9**, Allen as modified teaches distributing the state machine events between one or more threads in the portable thread environment (to itself or to another object; col. 10, lines 40-44).
- 18. **As to claim 10**, Allen as modified teaches distributing the state machine events between one or more threads in the portable thread environment and a second portable thread environment (it can also calls to new_event() to submit additional events to itself or to another object; col. 10, lines 27-44 and Jam_event; col. 9, lines 48-52 and Band State Machine; col. 7, lines 6-33).
- 19. **As to system and computer product claims 11 and 16**, they correspond to the method claim of claim 6, respectively.
- 20. As to claims 12 and 17, see rejection of claim 7 above.
- 21. As to claims 13 and 18, see rejection of claim 8 above.

Application/Control Number: 09/851,721

Art Unit: 2126

22. As to claims 14 and 19, see rejection of claim 9 above.

23. As to claims 15 and 20, see rejection of claim 10 above.

Conclusion

- 24. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
 - Kasuya (U.S. 5,905,883) teaches "Verification system for circuit simulator".
 - Barnabas Projects Limited teaches "State-Event Executive User Guide".

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Diem K Cao whose telephone number is (703) 305-5220. The examiner can normally be reached on Monday - Thursday, 9:00AM - 5:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Meng-Ai An can be reached on (703) 305-9678. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
